

A Novel, Hierarchically Developed Surface Kinetics for Oxidation and Reforming of Methane and Propane over Rh/Al₂O₃

Filesize: 2.66 MB

Reviews

This ebook will never be straightforward to get started on looking at but really fun to read. It is amongst the most incredible publication i have got read through. I realized this pdf from my i and dad encouraged this publication to learn.

(Mrs. Anya Kautzer)

A NOVEL, HIERARCHICALLY DEVELOPED SURFACE KINETICS FOR OXIDATION AND REFORMING OF METHANE AND PROPANE OVER RH/AL₂O₃

Shaker Verlag Okt 2013, 2013. Buch. Book Condition: Neu. 214x149x17 mm. Neuware - This thesis focuses on the development of a surface reaction mechanism for oxidation of H₂ and CO, water-gas shift (WGS) as well as reverse water-gas shift (R-WGS) reactions and partial/total oxidation and steam/dry reforming of methane and propane over Rh/Al₂O₃ catalyst. The study aims at providing a better understanding of the reaction kinetics of synthesis gas production. A stagnation-flow reactor set-up has been developed and constructed to study the reaction kinetics of various gas fuels (e.g., H₂, CO, CH₄, C₂H₆, C₃H₈) and evaporated liquids (e.g., water, ethanol, methanol, iso-octane). The reactor configuration facilitates one-dimensional (1D) modeling of coupled diffusive and convective transport within the gas-phase boundary layer with detailed heterogeneous chemistry model. As a result, well-defined boundary conditions are created, and heat and mass transport effects are eliminated from the kinetic model. Boundary-layer composition profiles of the species are measured by using a micro-probe sampling technique. Gas-phase concentrations of the species are simultaneously analyzed by MS and FTIR. The stagnation disk is coated with a Rh/Al₂O₃ catalyst by spin-spray technique. Light microscopy (LM), scanning electron microscopy (SEM), and transmission electron microscopy (TEM) are applied for the determination of the physical properties of the catalyst to reveal the interaction between the support and the active phase. A new CO chemisorption TPD technique is developed for the measurement of the catalytically active surface area of the stagnation disk. The experiments are conducted in the stagnation-flow reactor following a hierarchical approach in the development of suitable kinetic model for oxidation and reforming of light hydrocarbons. All possible reaction paths of partial oxidation and reforming of methane and propane are considered. The complexities of the systems are augmented by increasing the complexity of fuel type and reactant composition. H₂ oxidation, CO...
